

Update .p4 file has been added to assignment 5 on Github at <https://github.com/tauzn-clock/CWM-ProgNets>.

P4 file structure is similar to that as Assignment 3, except now we are trying to pipe the packets between two machines rather than back to itself.

Essentially, we have configured the IP address of Raspberry Pi #0 and #2 and their connection ports to be on the same sub mask.

We then configure the route table of Raspberry Pi #1 to set up the link between the 2 Pi.

We then edit the control plane with use table_add to pipe packets between the two machines.
